

AI-Powered Web App Demo in 30 Minutes

[0:00] Uh, services- sorry, business services and AI analyst.

[0:06] You'll probably hear from me in, say, a couple of months.

[0:11] Till then, I'm happy to take questions, but I will- I don't guarantee answers.

[0:18] I've spent around 9 years working at McKinsey, serving tech services clients, after which I joined Bernstein in this week.

[0:30] I have worked on all kinds of problem statements, growth, strategy, transformation, and more recently I've worked in serving clients on agent API.

[0:44] Really happy to see such a great turnout, and yes, excited to be here.

[0:50] So, yeah, let's begin.

[0:53] In this new world with several AI developments, it's an exciting time to be alive.

[1:00] To talk about this, we have Ashwin Gurbakshani here today with us.

[1:07] Ashwin is an AI-native founder based in Mumbai, building privacy-first AI solutions.

[1:15] His career spans across two distinct chapters: he started off with advertising, building- creating award-winning campaigns for Google, Coca-Cola, Bacardi, etc., and then taught himself to code, got into software, played several roles through the years, including being a Silicon Valley product manager, the CEO of a Delaware-based company, and more recently a solopreneur.

[1:50] He once built and launched a top 5 product app in under an hour, and his open-source code quietly runs in production at the likes of Apple, Spotify, BBC, etc.

[2:05] In fact, some code that he has written exists now in GitHub's Thousand Year Arctic Vault.

[2:14] It's a vault in an Arctic mountain in Norway that is in deep permafrost, with

billions of lines of code that will stay for 1,000 years, even 2,000 years long after we are gone.

[2:31] So today he's going to talk us through building- how easy, or difficult, you should tell us- it is to build an AI product, guided by a simple belief: that AI and open source are actually the biggest force multipliers of value today, and not everyone has discovered this yet.

[2:57] So I welcome Ashwin to talk us through the next 30 minutes.

[3:03] Thank you.

[3:04] Thank you so much.

[3:05] Before we even begin with the presentation, I want to address some of the conversations I've been having in this room since the morning.

[3:16] People have walked up to me- are we good?- people have walked up to me with a sense of fear around technology.

[3:24] There is a certain expectation that this is going to take some sort of Mensah-level IQ.

[3:31] I'm here to dispel all of that.

[3:33] It just takes one person with persistence.

[3:36] And what you need for this entire session to be most useful to you is not any sort of laptop with a code editor.

[3:45] You don't even need anything to take notes on.

[3:48] You could, if you want to.

[3:50] The most important thing you need to get the most out of the session is only and only your attention.

[3:58] I'm going to try and make things extremely simple by turning this into an origin story of yours.

[4:05] As Anuja rightly introduced me, it introduced both of the phases of my career: advertising and technology.

[4:13] There was one key link.

[4:15] The work I did in advertising, especially with Wipro, got me in love with technology.

[4:21] That was the catalyst for me.

[4:24] It was something that sparked my interest in robotics, in web development, and I started participating in hackathons, and suddenly my whole friend circle was full of geeky nerds.

[4:36] One fine evening, I sent an email to one of those nerds, and it just read, "Hi.

[4:42] I heard that you're working on something interesting, and here's what I'm trying to solve.

[4:48] Do you think you'd want to give me access to it?"

[4:51] I got a response within 6 hours, and I got access to ChatGPT, because that nerd was Greg Rothman, who is, and also was, the Chief Technology Officer of OpenAI.

[5:02] I was amongst the one- I was amongst the first 1,000 people on Earth, not in India, not in Mumbai, on Earth, to get access to ChatGPT.

[5:12] And the atmosphere in that room, with brilliant AI researchers, was electrifying.

[5:17] And I wish to transfer some of that atmosphere here, and the enthusiasm that hasn't died down- in fact, it has amplified since that year- to this room.

[5:28] Now, let's start with a conversation.

[5:30] I'd like you all to raise your hands if you have an idea for an app or a website.

[5:36] Please don't be shy.

[5:37] Raise your hands.

[5:39] We all do.

[5:39] Quite a few hands are going up.

[5:42] There's no NDAs to be signed here.

[5:44] Okay.

[5:45] You're going to get a lot of value from this, but now I also want you to keep your hands raised if you built that app and launched it somewhere.

[5:55] We have one person, and everyone else's hands went down.

[5:59] You see, that is the gap between the potential and the actuation of ideas in this room, and it's enormous.

[6:07] Technology is an amplifier, but it needs domain expertise, and this room is full of domain expertise.

[6:15] What we do throughout the session is figure out how to use technology to amplify your ideas and bring them into the real world as products, as solutions, as websites, and as apps.

[6:28] It's up to you to decide what to do with this superpower.

[6:32] We're going to be building a marketplace, something like an OLX or a Craigslist, somewhere where people log in, register, and post items for sale and purchase.

[6:44] We deliberately chose this sort of a website because everybody knows how it works, and it touches upon every single aspect of modern interactive solution development.

[6:57] And if you took a project like this to a traditional IT services company, let's say, for example, Infosys, it's going to take them 3 months, with a team of 3 people.

[7:09] That's 9 human months.

[7:11] There would- I'm not even mentioning the specification back and forth, the quotation, and managing leads, etc.

[7:19] But as you'll see throughout this demo, we're going to have that ready in 30 minutes.

[7:26] Even before the quotation PDF reaches our client's inbox, we would have shipped version 1 of our product.

[7:34] There are 4 essential parts of every single web application, every single piece of technology that you create in the modern web: the template, the front end, the back end, and the model.

[7:49] Now, we're going to go deeper into all 4 of them, and you'll see how all of these combine to create something that is significantly greater than them individually.

[8:01] So yesterday, I- yesterday while preparing for this talk, I created a template of sorts.

[8:08] A template is something that- something that abstracts away so much of the complexities of web development.

[8:17] If you log onto a website today, if you open an app today, you don't realize the amount of duct tape, the amount of requests being made to various servers, and how they have to coordinate together that goes on behind the scenes.

[8:35] But lucky for us, some incredibly brilliant engineers at fine companies and even individual contributors have open-sourced this technology.

[8:46] They've open-sourced it as not charity, but craft.

[8:49] It takes an incredible amount of engineering to create a template, and SvelteKit is one of them.

[8:55] The others, of course, you would have heard of, are React, Vue, Angular, etc.

[9:00] We're focusing on Svelte because it's the simplest and it has a very mature AI ecosystem.

[9:06] To get SvelteKit working on your computer, open any terminal- it could be Windows, Mac, or Linux- and just type in these random-looking words.

[9:15] All you need to remember is `npx sv`, and then you have to tell it to create a local marketplace, what we're building.

[9:22] Remember, `npx` is our friend.

[9:24] It's the entry- it's the gateway to most of programming.

[9:28] We're going to see him again.

[9:30] So we've just typed in these 4 words into the terminal, and it's going to suggest us what sort of integrations we need to create for the internet.

[9:39] I'm just going to select the defaults, nothing to customize it.

[9:43] The defaults are good enough for most cases.

[9:46] The one thing I will change, though, is select the AI tools, because that's something that's going to give us developmental superpowers.

[9:55] I've selected the AI tools, and it's asking me which coding assistant am I going to select.

[10:01] Throughout this demonstration, I'm using Gemini.

[10:05] You're free to use any coding assistant of your choice.

[10:09] The workflow is exactly the same, and it selects the AI integrations for an MCP server and skills.

[10:18] We're going to use them in just a few minutes.

[10:22] It has created the project, and it's asking me how do I want to manage all of the technologies that go in within the project.

[10:33] Again, I selected the default.

[10:35] And it's- and once it's done installing, it's going to tell me exactly what to do for the next steps.

[10:44] There you go.

[10:45] It's asking me to run these 2 commands, and it's also very helpfully telling me that there's a Discord chat room that the creators of the Svelte library have created for people like us to directly have a one-on-one conversation with the people who made this.

[11:07] I'm going to show you a glimpse of that very soon.

[11:12] I'm going to open the folder and go into the code that was generated.

[11:18] Again, I didn't type anything other than the initial 5 letters, and all of this is just- I'm reading and copy-pasting.

[11:28] That's going to be most of the seminar.

[11:31] You don't even need to write- forget esoteric lines of code.

[11:36] You just need to copy and paste what the system tells you, and it's good enough.

[11:42] So there you go.

[11:43] This is a default SvelteKit project, a default template.

[11:46] It's an empty app.

[11:47] It's a website that could exist on the internet right now, but it's not very useful.

[11:53] What we're going to do, progressively over the next few minutes, is going- is we're going to make it a lot more useful to real users.

[12:02] This is the Discord chat room that I was referring to.

[12:05] If you have any questions, you can directly speak with the people who made

this template itself.

[12:12] Now, I know what you're thinking.

[12:14] What is this Discord?

[12:15] What is this copy-pasting code?

[12:17] Is this some hobby project?

[12:19] I have news for you.

[12:21] It's not.

[12:21] It's the same project that powers Spotify and Apple's web app store.

[12:26] Literally the most valuable piece of retail real estate on the internet uses exactly this technology, and it's that easy.

[12:34] You have the base framework open.

[12:36] I'm just opening a code editor.

[12:38] You can use anything that you want.

[12:40] Again, I'm not going to write a line of code.

[12:43] I'm just opening it just to show you what a typical workflow would look like.

[12:49] Now, this is something extremely interesting.

[12:53] This is an idea that's borrowed from manufacturing.

[12:57] If you want to bake 10,000 cookies, you don't bake them by hand.

[13:01] You have a cookie cutter, and you stack out 10,000 cookies.

[13:06] This is the same idea.

[13:08] On our website, there'd be various products, from an iPhone to a sofa to a car.

[13:14] And what I've created is a product info box, and that box is going to be replicated throughout our website, and it's going to look something like this.

[13:25] There you go.

[13:26] It was that easy.

[13:27] This is the cookie cutter mentality that literally takes your development speed from linear to exponential, and it's an excellent thing because this minimizes so much of the repetitive processes.

[13:42] And hang on, this is not what our app is going to look like.

[13:47] Not even close.

[13:48] But this is the template functionality that I wanted to quickly demonstrate for you.

[13:54] Now we have a solid foundation ready for telling the system, telling the internet how to fetch product information, what is the structure of our product information.

[14:07] What we're going to look at is something more interesting.

[14:11] It's the vocabulary of good design.

[14:14] I don't want to sound self-critical, but what you saw a few seconds ago was kind of embarrassing.

[14:22] That's not something that I would put on the live internet and expect thousands of users to sign up for.

[14:29] But that did put in place- that did create the opportunity for me to use something called an impeccable skill.

[14:36] The impeccable skill gives you vocabulary for great design.

[14:40] If- let's say if you have feedback on a website, how would you give that feedback?

[14:45] Like, if you want a website to look good, open question to the audience.

[14:49] You see a website on the internet, and it looks ugly.

[14:53] What would- what would your feedback be?

[15:04] Would you just accept that website?

[15:06] No, we wouldn't.

[15:08] But here's the thing: the silence in this room is more telling.

[15:12] We don't have a vocabulary for excellent design.

[15:16] We don't know what to say.

[15:18] We don't know what pixel leading is.

[15:20] We don't know what kerning is.

[15:23] And that's okay, because we are not professional designers.

[15:27] Impeccable Styles solves exactly this problem: we're going to create a beautiful front-end by, again, here's our friend NPX again, by just saying `npx install`, excuse me, `npx impeccable install`.

[15:41] That's it.

[15:42] And just select the defaults one more time.

[15:45] It's downloading everything and plugging it up with my own AI coding harness, and it's telling me to continue using it with my coding assistant.

[15:56] Now, here's something fascinating that's going to happen: I'll tell my coding assistant, Gemini in this case, to say, "impeccable init," meaning initialize this project.

[16:09] It's going to scan my entire codebase, get an understanding of what we're trying to build.

[16:15] This is where the cookie cutter template from a few minutes ago was useful.

[16:21] Now that it has an understanding for what it is, it's going to look at its own training database.

[16:28] Impeccable is trained on millions of beautiful, usable, and successful websites that are high converting.

[16:37] So it's looking at my current code, it's analyzing the product info box that I created as a demonstration, and it's asking me some very important questions.

[16:49] Who will be using your local marketplace, and what's the main goal?

[16:54] This is not something an AI would ask you if it's not trained specifically on design skills.

[17:01] I don't have to type in anything, but if I want to, I can write a manual answer by selecting "for" and "others."

[17:10] I'll just select the first one.

[17:12] Looks good.

[17:13] What makes the local marketplace special?

[17:17] I think I would select, uh, maybe it's a clean browsing experience for me.

[17:22] That's important for a local marketplace.

[17:26] Then any specific features that we'd like to prioritize.

[17:30] I selected the first default again.

[17:33] All I've done is clicked "next" three times.

[17:36] Now it's creating something called the product.md.

[17:40] The product specification, I'm going to show you in a minute.

[17:45] It's asking me more follow-up questions.

[17:48] The visual design.

[17:49] I'm okay with the recommended.

[17:52] In fact, I have some, uh, specific direction for this.

[17:56] Mobile responsiveness should be very important.

[17:59] Simple, easy-to-use interface, because it's a complicated app.

[18:04] And it should load super fast.

[18:07] Simple English.

[18:08] No design terminology yet.

[18:10] I hit enter, and it shaped everything up.

[18:14] The product.md file that it created over here is extremely interesting, because that's where the secret sauce happens.

[18:24] It's translated my basic English input into something that a designer and an AI coding harness could find significantly more useful.

[18:36] I don't have to touch it, but I'm just showing it to you to show you under the hood how this system works.

[18:45] That's pretty much the direction that I gave it.

[18:50] Now I'm telling it to just design the homepage.

[18:54] That's it.

[18:55] Heh.

[18:55] This is the kind of backspace that we do when we write an email.

[19:01] I kept it in because I just want to show you there's no superpower here.

[19:07] This is just a normal human being typing into a text box.

[19:12] I reiterated my preference for ease of use.

[19:16] Most of this is in real time, but if there was an AI loop, if there was any agentic loop which caused it to, uh, caused it to think for longer, I've edited that out.

[19:31] It created its own implementation plan.

[19:34] I've asked it to just go ahead with it.

[19:38] And notice that it started changing the layout.

[19:42] It created a category bar.

[19:44] It created a nav bar.

[19:46] It created an item details pop-up box.

[19:48] It created the pro it edited our product info box.

[19:52] A trust banner, a footer, none of this is what I asked it to do.

[19:57] And there you go.

[19:58] We went from a cookie cutter website to this, in minutes, for free.

[20:03] All it took was copy-pasting one command and answering simple questions in plain human English.

[20:11] And it also made a beautiful mobile responsive web app to go with it.

[20:16] The category features work.

[20:18] And I think, uh, posting to a bo- creating a new listing sort of works as well.

[20:24] But there's a caveat over here, and I'll get to it.

[20:28] If I want to sell a laptop, I can create a listing.

[20:32] Now, what you saw here-in fact, I'm going to go back to this.

[20:36] What you saw over here is super interesting for two main reasons.

[20:41] To us, it looks beautiful.

[20:43] At least to me, it does.

[20:45] And it's great for something that can be spun up within minutes.

[20:50] However, truth be told, this is nothing more than a flint set.

[20:55] It's fake.

[20:55] It's not connected to anything on the internet yet.

[20:59] It is a glorified interactive demo, is what it is.

[21:03] There is real code inside of it, but because that code does not connect to anywhere else, nobody can sign up, nobody can create a listing, and nobody can sell anything therefore.

[21:15] So this is getting us halfway there.

[21:17] So it looks like an actual app, but it doesn't work like one.

[21:21] To make it work like one, we need to connect it to a back-end.

[21:25] Now, back-ends are super interesting, and these are places where a lot of people have a lot of strong opinions.

[21:33] I have a simple one.

[21:34] Don't reinvent the wheel.

[21:36] A back-end is simply something akin to an Excel spreadsheet with different rows, and there is one row with my name on it, and I'm only allowed to access that row.

[21:47] There is another row with someone else's name on it, and they cannot access my row.

[21:52] That's all a back-end is.

[21:54] So think of a back-end as an Excel spreadsheet with a bouncer.

[21:58] To use this, I'm going to use Supabase, which is a decentered, stablecoin, \$10 billion corporation funded by [Vice Seed](#).

[22:06] I just said, "Create a new project," and, uh, generated a default password.

[22:14] Just go to [supabase.com](#) and follow, uh, just click along through the next, next, next buttons.

[22:21] It's spinning up a Supabase project, which will be a back-end, and it's healthy.

[22:27] It's ready now.

[22:29] I'm going to connect it to our codebase that was generated a few minutes ago by just clicking copy.

[22:36] That's all I had to do.

[22:38] Click on connect, click on copy, go here, and paste.

[22:42] That's it.

[22:43] It could not get easier.

[22:45] How am I doing on the promise of no code?

[22:48] There's literally not been anything esoteric here.

[22:52] All I've done is use plain English.

[22:55] And once we have this, uh, spinning up autonomously, it'll connect itself to our back-end, and we'll have a live working app.

[23:05] I'm going to give you a demo of that in just a minute.

[23:09] It's installing a skin, which would tell our coding agent what Supabase is and how to use it.

[23:17] And I just wanted to, uh, analyze our codebase and get connected and build out the app functionality.

[23:25] It's executing SQL, which is another one of those esoteric terms we don't really need to understand.

[23:33] It's structured query language, but I haven't written anything.

[23:38] I've just copy-pasted instructions.

[23:41] But I understand what it's writing, and it's fairly accurate.

[23:46] It's asking me for permission to apply its changes, and I'll allow it.

[23:51] I think it succeeded.

[23:53] Now, if we go back to our freshly created back-end, the Supabase project, it's going to show us something that would have taken developers weeks, if not months,

of honest work.

[24:07] This here is your bouncer.

[24:10] This is your entire back-end.

[24:12] It has locations, it has listings, it has profiles, categories, everything that we created.

[24:19] Something that you would see in a live production app that would usually take months to build.

[24:27] It just took minutes right now.

[24:30] All for free.

[24:31] All it did was copy-paste commands.

[24:33] The row-level security is the bouncer analogy, the RLS, uh, that I brought up.

[24:40] So nobody is allowed to edit any of my products, nobody is allowed to, uh, change any of my information, and all of these are templated.

[24:51] So I can, again, just click and have those be in effect.

[24:56] So we have a live working product where we can create an account, register, and sell something on the internet live.

[25:05] There you go.

[25:06] It's asking me to save the password as well.

[25:10] Proof that it worked.

[25:12] How do you save it?

[25:13] And I've logged in, as I showed you.

[25:15] Okay.

[25:15] So please go into iPhone and.

[25:20] Now, throughout all of this, you're probably thinking that, "Hey, Ashwin, this is fine and all," but you've been using something that we can't verify.

[25:30] You've been using Gemini.

[25:32] What about business data?

[25:34] What about integrity?

[25:35] What about privacy and security?

[25:38] Valid questions.

[25:39] Excellent concerns.

[25:40] Luckily, that's where open source comes in.

[25:43] I want to introduce you to Hugging Face.

[25:46] Hugging Face is a funny-sounding name for a site that basically hosts all of the models on the internet.

[25:53] Think of it like the Spotify for AI models.

[25:56] And all of these are open source.

[25:58] You can see there's more than 2 million models on Hugging Face from basically the entire world.

[26:05] But I would encourage you to not just go and select the most popular model, because popular almost always never, uh, equals the best.

[26:14] We have a better problem now.

[26:16] We have a problem of discoverability, to know which one is better.

[26:20] So I'm going to go to this website called arena.ai.

[26:24] arena.ai is sort of like a blind taste test for models, where a lot of people have come together to, uh, put AI models against each other without knowing which ones they are.

[26:36] So quality always wins over here.

[26:38] I've selected code, and I'm filtered by the filtered by the license, and I see that DeepSeek is one which, uh, is among the top models over there.

[26:48] Yes, uh, DeepSeek from China.

[26:50] That one.

[26:51] We have a lot of strong opinions about that model in this room, but I'm going to soon show you, within minutes, how that's not going to matter.

[27:01] I just opened another coding assistant and said, "Use the DeepSeek V4 model," and continued the task of polishing the homepage by switching models without even really thinking about jumping from Gemini to DeepSeek.

[27:16] It's that interoperable.

[27:17] So that's how easy it is to go from version, uh, go to from zero to one in, uh, from zero to one in web development today.

[27:26] This literally took less than 10 minutes.

[27:29] But the analogy that I want to bring to this room here is, what about security?

[27:34] What about privacy?

[27:35] Someone once told me a good analogy for this.

[27:38] Uh, if you're if you're trusting Google with your data, if you're trusting OpenAI,

or if you're trusting Anthropic, you're trusting their license agreements.

[27:49] You're trusting that, uh, a lawyer who's never met you before has your back.

[27:55] You're also trusting that the employees who are safeguarding their database, their database servers, are also having great care.

[28:03] But that's not the case that you need to do anymore at all.

[28:06] You can simply own your own database server, and you can run it on-prem.

[28:11] In fact, most people don't even realize this.

[28:14] I have a database right here in my pocket.

[28:16] That's how good the technology has become.

[28:19] It's so small that you can fit it in something that looks like a little long a little bigger than a bar of chocolate.

[28:26] And this little device is capable of 12 trillion operations per second, and it runs for 5 rupees a day at my house, powering most of my AI projects.

[28:35] Now, in a world where hosting intelligence has become so secularized, so democratized, what are the implications?

[28:43] What does this mean?

[28:44] There are three.

[28:45] There are three things that I'd like to take that I'd like you to take away from this conversation.

[28:51] The first one is what it means for you as an individual.

[28:54] Of course, the next question is what it means for businesses, what it means for organizations, and what it means for the world.

[29:03] First up, this is not a talent gap anymore.

[29:06] It's a translation gap.

[29:07] The conversation that we had at the start of this presentation about who has an idea but hasn't built one yet, that is diminishing.

[29:16] That has almost entirely vanished.

[29:18] If you follow these steps that I showed you, you are in the leagues of developing software which is capable which is, uh, on the tech stack at least, is comparable to Vice Seed-like startups and Apple itself.

[29:32] So you're in great hands.

[29:33] So there's literally no excuse for you to not explore this, uh, this superpower any, uh, further, because if you can think it, you can basically build it.

[29:43] The other more interesting analogy is that about organizations.

[29:48] When we think of AI adoptions, uh, it was very tempting to think that an organization will give all of its employees ChatGPT subscriptions, and then productivity would increase.

[30:01] It would increase by 10%, 20%, 50% on a good team.

[30:05] But that's not a generational leap.

[30:07] What we're looking at is not making something faster.

[30:12] The analogy here again is imagine you're running a transportation company in Mumbai.

[30:19] And you give your entire fleet of drivers a Ferrari.

[30:24] What would you have?

[30:25] Sure, you'd have faster cars, but you'd also have cars that are harder to control.

[30:29] and you'd have cars that are more expensive and you'd have these cars driving on Indian roads.

[30:35] That's the world's most expensive traffic jam.

[30:39] Instead what I propose is this model of thinking.

[30:41] You don't need faster cars, you don't need a Ferrari, you need a teleporter.

[30:46] Imagine if that transportation company was able to create teleporters directly to their customers homes and fulfill their deliveries.

[30:53] That is the more interesting implication of this technology for organizations.

[30:58] Not work that is done faster, new kind of work that was never before possible.

[31:03] And in this entire country, it's criminally underrated how little our organizations are talking about this possibility of teleportal solutions.

[31:14] Now, conversation that has been happening in this room since the morning has been, should India build its own models?

[31:22] My response to that is yes and no.

[31:25] And I'd lean more towards no.

[31:27] Because yes, it's true that we are late to the LLM game.

[31:31] But late doesn't always mean wrong.

[31:33] Apple was late to so many technologies, famously.

[31:37] We have precedence for this.

[31:38] What we need to do instead is we can take an open source open weights model, modify that and customize it to Indian needs and plug it into the greater global ecosystem that is still emerging in AI.

[31:51] it's still early days and what we do there would be significantly less cost intensive it'll be a lot cheaper and it'll bring us uh it it'll bring us on par with uh Global models within days in fact it's easy to train a model on any on any open source infrastructure it can happen over the weekend I've done it there are many countries that have gone down this route.

[32:21] China has done this before with their Deepin operating system, which is adapting from Linux OS.

[32:29] India has done it before with Garuda Linux, which is again taking open source technology and adapting it for Indian needs.

[32:36] I think we can do it again fairly simply, and that would be a great use of our energies.

[32:43] Now, I hope that you're convinced that If you can take it, you can build it.

[32:49] But I know this was a lot to take in for one seminar.

[32:53] But what it was, was a lot of clicking.

[32:56] There was a lot of buttons.

[32:57] You just click here, click OK, and select the default in most cases.

[33:02] But if you can click a button, I'd like you to click another one.

[33:07] This entire talk has just this morning been made open source.

[33:12] You can scan this.

[33:13] Get all of my speaker notes, get the entire presentation, get the links to all of the technologies that I discussed and explore this on your own time for free without anyone's permission.

[33:24] There's no tracking, there's nothing that's stopping you from just going there and using it at your own speed and going to build your dreams.

[33:32] That's been my talk.

[33:33] Thank you.

[33:42] Okay, thanks Akanksha for that.

[33:46] Very exciting.

[33:47] I have like a bunch of questions but we're running short on time so I'm gonna take only a few.

[33:55] Actually, so one of the things that you showed was it was hosted locally.

[34:01] How does it connect to the internet?

[34:03] How do we host it?

[34:04] Excellent question.

[34:05] So the keen eye amongst you notice the local host, yes it is hosted locally.

[34:10] What you need to do is depending on your infrastructure, you'd have to either go to some place like Vercel, which has excellent AI capabilities, or Cloudflare, or do it like I do on my own AI server, which was in the pocket few minutes ago.

[34:24] And how is what you made different from, say, using Cloud Code?

[34:31] Great.

[34:32] So what I made gives you granularity, and you can use my workflow in Cloud Code itself as well.

[34:39] The thing that I wanted to emphasize through this talk is the underlying pipelines, the MCPs, the skills, and the need to not even write a single line of code.

[34:48] This workflow can be followed in Cloud Code, in Gemini, in OpenAI Codex, or of course, as I thought towards the end of it, in any models in my own coding harness called Py.

[34:58] So that's fine.

[35:02] Then let's talk about all the tools that you used, you would have to spend credits for it, right?

[35:08] What about anti-gravity?

[35:10] Is it like open source and credits?

[35:13] And second is, some people are asking if there could be security risks associated with open source.

[35:21] So taking say, licensed copilot or AWS, would that actually work?

[35:29] Great, so these are two different questions.

[35:30] I'll address them like this.

[35:33] Firstly, the cost.

[35:35] Because we live in India, we have excellent access to some of the world's best subsidized technology.

[35:39] And Jio has a partnership with Google, and every student and every Jio subscriber gets to use this basically for free.

[35:48] Other than that, it's also fairly cost-effective.

[35:50] I've used many different products, and none of the projects, live web projects I've used have gone about 4,500 rupees for entire end-to-end from idea to live website with users.

[36:02] So that's the scale of the cost.

[36:04] You can choose to change this by doing it on your own hardware, but then again you'd have to invest in something like an H100, which costs 40 lakh rupees.

[36:14] That's a data center scale.

[36:16] But what about the device that you showed when you said you can run an AI

application based off of that?

[36:25] Correct.

[36:25] So I want to temper some expectations here.

[36:29] You can run AI applications off of your own hardware.

[36:31] In fact, Gemma 4 is a recent model that Google released which can run on pretty much anyone's modern phone today.

[36:38] But that model is not going to create the entire code base like I showed you a few minutes ago.

[36:43] That you'd still need a powerful computer for.

[36:46] What it can do is create specific snippets of tiny code and that is something that you could use.

[36:51] So you're trading a convenience for speed.

[36:54] The other part of the question was, I think, at the infrastructure level, right?

[36:59] So that question would be answered by hosting your own cloud services on-prem.

[37:06] So that means you are responsible for your own security.

[37:09] The analogy that I brought up in the presentation was rather than, let's say you have a stack of gold.

[37:17] You can either hire a guard and trust that the guard is having a good day and it's in their best policies to not damage that gold or steal anything.

[37:26] Or you could just take that gold, put it in a vault in your own home, lock the keys and you'd be safe.

[37:31] What would make you feel safer?

[37:33] I'm leaning more towards the more you lock the keys in your own home.

[37:37] which is why I strongly encourage open source self-hosting on-prem.

[37:42] And it's also part of the larger growing ecosystem.

[37:44] So there's more freedom.

[37:46] So that is more secure than--.

[37:48] If you know what you're doing.

[37:50] And open source.

[37:51] Correct.

[37:52] But you have to make sure that there are no vulnerabilities in that.

[37:55] If you know what you're doing, that's a very viable option.

[38:00] Let's talk about the-- Last, perhaps, few questions.

[38:04] The 30-minute prototype.

[38:06] Yes.

[38:06] And what time do you hit a wall from building an enterprise-grade product?

[38:13] And also the second implication, what part of traditional IT services gets completely commoditized because you have this?

[38:22] I'll ask the second question first.

[38:24] It's the part that the traditional IT services would want to commoditize because we have an incentives mismatch over here.

[38:31] Traditional IT services built by the R, so therefore it's in their best interest to

not adopt to the teleporter model or not even go to a Ferrari model.

[38:41] That is one incentive, and I always believe in incentives dictate behaviors.

[38:45] What was the first question?

[38:48] What point do you hit a wall from building an enterprise data product?

[38:52] You don't.

[38:52] Spotify famously said that since December last year, none of their engineers have written a single line of code.

[38:58] And I believe them.

[39:01] There's also a caveat that their engineers are highly skilled and they know how to test and what deterministically tells them that this is a vulnerability versus this is a bug versus this is a false positive.

[39:12] There is real thinking involved but not typing out code.

[39:16] Okay.

[39:18] Thank you.

[39:19] I think the last question, can you double click if agent orchestration is possible through the anti-gravity ID?

[39:28] Yes, it is.

[39:29] However, you can't take the antigravity ID works off of Gemini.

[39:35] You can't take your Gemini subscription and plug it into your app and give it to your users.

[39:39] What you would need to do is plug in Google's AI Studio.

[39:44] That's what the platform is, AI Studio platform API key, much like you would do

with the OpenAI or Anthropic API key into the system.

[39:52] So we are comparing Apple to knowledge.

[39:58] I think that was it.

[40:01] Thank you so much for spending the time with us.

[40:03] And I'm hoping a lot of us go back home and build our own products.
